Цель работы

Получение первичных навыков в организации долгосрочного хранения данных с использованием PostgreSQL и Golang.

Ход работы

Задание

Переделать коды из 6 лабораторной работы в микросервисы и организовать клиент-серверное взаимодействие между Golang и PostgreSQL.

Микросервис hello:

```
package main

import (
    "database/sql"
    "encoding/json"
    "flag"
    "fmt"
    "log"
    "net/http"

    _ "github.com/lib/pq"
)

const (
    host = "localhost"
    port = 5432
    user = "ps1"
    password = "1103"
    dbname = "sandbox"
)

type Handlers struct {
    dbProvider DatabaseProvider
}

type DatabaseProvider struct {
    db *sql.DB
}
```

```

// Обработчики HTTP-запросов
func (h *Handlers) GetHello(w http.ResponseWriter, r *http.Request) {
    msg, err := h.dbProvider.SelectHello()
    if err != nil {
        w.WriteHeader(http.StatusInternalServerError)
        w.Write([]byte(err.Error()))
    }

    w.WriteHeader(http.StatusOK)
    w.Write([]byte(msg))
}

func (h *Handlers) PostHello(w http.ResponseWriter, r *http.Request) {
    input := struct {
        Msg string `json:"msg"`
    }{}

    decoder := json.NewDecoder(r.Body)
    err := decoder.Decode(&input)
    if err != nil {
        if err != nil {
            w.WriteHeader(http.StatusBadRequest)
            w.Write([]byte(err.Error()))
        }
    }

    err = h.dbProvider.InsertHello(input.Msg)
    if err != nil {
        w.WriteHeader(http.StatusInternalServerError)
        w.Write([]byte(err.Error()))
    }

    w.WriteHeader(http.StatusCreated)
}

// Методы для работы с базой данных
func (dp *DatabaseProvider) SelectHello() (string, error) {
    var msg string

    // Получаем одно сообщение из таблицы hello, отсортированной в
    случайном порядке

```

```

row := dp.db.QueryRow("SELECT message FROM hello ORDER BY
RANDOM() LIMIT 1")
err := row.Scan(&msg)
if err != nil {
return "", err
}

return msg, nil
}
func (dp *DatabaseProvider) InsertHello(msg string) error {
_, err := dp.db.Exec("INSERT INTO hello (message) VALUES ($1)", msg)
if err != nil {
return err
}

return nil
}

func main() {
// Считываем аргументы командной строки
address := flag.String("address", "127.0.0.1:8081", "адрес для запуска
сервера")
flag.Parse()

// Формирование строки подключения для postgres
psqlInfo := fmt.Sprintf("host=%s port=%d user=%s "+
"password=%s dbname=%s sslmode=disable",
host, port, user, password, dbname)

// Создание соединения с сервером postgres
db, err := sql.Open("postgres", psqlInfo)
if err != nil {
log.Fatal(err)
}
defer db.Close()

// Создаем провайдер для БД с набором методов
dp := DatabaseProvider{db: db}
// Создаем экземпляр структуры с набором обработчиков
h := Handlers{dbProvider: dp}

```

```
// Регистрируем обработчики
http.HandleFunc("/get", h.GetHello)
http.HandleFunc("/post", h.PostHello)

// Запускаем веб-сервер на указанном адресе
err = http.ListenAndServe(*address, nil)
if err != nil {
log.Fatal(err)
}
}
```

http.HandleFunc("/post", h.PostQuery)

```

The screenshot shows a REST client interface with the following components:

- Environment Bar:** Displays the current environment as "No environment".
- Request Bar:** Shows the method "GET" and the URL "127.0.0.1:8083/get?name=Ivan".
- Response Bar:** Shows the status "200 OK", response time "3 ms", and response size "128 B".
- Body Tab:** Displays the response body "Hello, Ivan!".
- Navigation Bar:** Includes tabs for "Params", "Auth", "Headers (7)", "Body", "Scripts", and "Settings".
- Format Selectors:** Includes "raw" and "JSON" buttons.
- Actions:** Includes "Save", "Send", "Cookies", and "Beautify" buttons.

Вывод

При выполнении заданий лабораторной были получены навыки по организации долгосрочного хранения данных с использованием PostgreSQL.
